Legal Provisions

The information contained in these documents is the property of SMA Solar Technology AG. No part of this document may be reproduced, stored in a retrieval system, or transmitted, in any form or by any means, be it electronic, mechanical, photographic, magnetic or otherwise, without the prior written permission of SMA Solar Technology AG. Internal reproduction used solely for the purpose of product evaluation or other proper use is allowed and does not require prior approval.

SMA Solar Technology AG makes no representations or warranties, express or implied, with respect to this documentation or any of the equipment and/or software it may describe, including (with no limitation) any implied warranties of utility, merchantability, or fitness for any particular purpose. All such representations or warranties are expressly disclaimed. Neither SMA Solar Technology AG nor its distributors or dealers shall be liable for any indirect, incidental, or consequential damages under any circumstances.

The exclusion of implied warranties may not apply in all cases under some statutes, and thus the above exclusion may not apply.

Specifications are subject to change without notice. Every attempt has been made to make this document complete, accurate and up-to-date. Readers are cautioned, however, that product improvements and field usage experience may cause SMA Solar Technology AG to make changes to these specifications without advance notice, or per contract provisions in those cases where a supply agreement requires advance notice. SMA Solar Technology AG shall not be responsible for any damages, including indirect, incidental or consequential damages, caused by reliance on the material presented, including, but not limited to, omissions, typographical errors, arithmetical errors or listing errors in the content material.

SMA Warranty
You can download the current warranty conditions from the Internet at www.SMA-Solar.com.

Software licenses
The licenses for the used software modules can be called up on the user interface of the product.

Trademarks
All trademarks are recognized, even if not explicitly identified as such. Missing designations do not mean that a product or brand is not a registered trademark.

1 Information on this Document

1.1 Validity
This document is valid for:
- SB3.8-1SP-US-40 (Sunny Boy 3.8-US) from firmware version ≥ 2.04.88.R
- SB5.0-1SP-US-40 (Sunny Boy 5.0-US) from firmware version ≥ 2.04.88.R
- SB6.0-1SP-US-40 (Sunny Boy 6.0-US) from firmware version ≥ 2.04.88.R
- SB7.0-1SP-US-40 (Sunny Boy 7.0-US) from firmware version ≥ 2.04.88.R
- SB7.7-1SP-US-40 (Sunny Boy 7.7-US) from firmware version ≥ 2.04.88.R

1.2 Target Group
The tasks described in this document must only be performed by qualified persons. Qualified persons must have the following skills:
- Knowledge of how an inverter works and is operated
- Training in how to deal with the dangers and risks associated with installing, repairing and using electrical devices and installations
- Training in the installation and commissioning of electrical devices and installations
- Knowledge of all applicable laws, standards and directives
- Knowledge of and compliance with this document and all safety information

1.3 Content and Structure of this Document
This document describes the installation, commissioning and decommissioning of the product.
You will find the latest version of this document and further information on the product in PDF format at www.SMA-Solar.com.
The latest version of this document and the manual for operating the user interface as well as information on configuration and troubleshooting of the product are to be found in PDF format at www.SMA-Solar.com.
Illustrations in this document are reduced to the essential information and may deviate from the real product.

1.4 Levels of warning messages
The following levels of warning messages may occur when handling the product.

<table>
<thead>
<tr>
<th>DANGER</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indicates a hazardous situation which, if not avoided, will result in death or serious injury.</td>
</tr>
</tbody>
</table>

<table>

2 Safety

2.1 Intended Use

The Sunny Boy is a transformerless PV inverter which converts the direct current of the PV array to grid-compliant alternating current and feeds it into the utility grid. The product is suitable for indoor and outdoor use. The product must only be operated with PV arrays (PV modules and cabling) that are approved by the electrical standards applicable on-site and the National Electrical Code® ANSI/NFPA 70 or the Canadian Electrical Code® CSA C22.1.

No galvanic isolation

The product is not equipped with a transformer and therefore has no galvanic isolation.

- Do not operate grounded PV modules together with the product. If grounded PV modules are connected to the product, an event will occur which will appear on the product display. The event will also be displayed, along with the associated message, in the event list on the user interface of the product.
- Only ground the mounting frames of the PV modules.
- The neutral conductor of the AC output is not bonded to ground within the product.
- The neutral conductor of the AC output for secure power supply operation is bonded to ground within the product.

PV modules with a high capacity to ground may only be used if their coupling capacity does not exceed 2.5 μF.

To protect the PV system against excessive reverse currents under fault conditions, a DC-side overcurrent protective device must be connected in accordance with the National Electrical Code® to prevent any short-circuit currents that exceed the ampacity of the DC electric circuit or the maximum series fuse rating of the PV modules. Typically, this requires string fusing where more than two strings are combined in parallel. Where an overcurrent protection device is required, the National Electrical Code® requires that both positive and negative conductors have overcurrent protection for ungrounded PV modules.

All components must remain within their permitted operating ranges and their installation requirements at all times.

The product is approved for the US and Canadian market.

Use this product only in accordance with the information provided in the enclosed documentation and with the locally applicable laws, regulations, standards and directives. Any other application may cause personal injury or property damage.

Alterations to the product, e.g. changes or modifications, are only permitted with the express written permission of SMA Solar Technology AG. Unauthorized alterations will void guarantee and warranty claims and in most cases terminate the operating license. SMA Solar Technology AG shall not be held liable for any damage caused by such changes.
Any use of the product other than that described in the Intended Use section does not qualify as the intended use.

The enclosed documentation is an integral part of this product. Keep the documentation in a convenient, dry place for future reference and observe all instructions contained therein.

This document does not replace and is not intended to replace any local, state, provincial, federal or national laws, regulations or codes applicable to the installation, electrical safety and use of the product. SMA Solar Technology AG assumes no responsibility for the compliance or non-compliance with such laws or codes in connection with the installation of the product.

The type label must remain permanently attached to the product.

## 2.2 IMPORTANT SAFETY INSTRUCTIONS

**SAVE THESE INSTRUCTIONS**

This section contains safety information that must be observed at all times when working on or with the product.

The product has been designed and tested in accordance with international safety requirements. As with all electrical or electronical devices, there are residual risks despite careful construction. To prevent personal injury and property damage and to ensure long-term operation of the product, read this section carefully and observe all safety information at all times.

### DANGER

**Danger to life due to electric shock when live components or DC conductors are touched**

When exposed to sunlight, the PV modules generate high DC voltage which is present in the DC conductors. Touching live DC conductors results in death or lethal injuries due to electric shock.

- Disconnect the product from voltage sources and make sure it cannot be reconnected before working on the device.
- Do not touch non-insulated parts or cables.
- Do not remove the terminal block with the connected DC conductors from the slot under load.
- Wear suitable personal protective equipment for all work on the product.
**DANGER**

Danger to life due to electric shock when touching live system components in case of a ground fault

If a ground fault occurs, parts of the system may still be live. Touching live parts and cables results in death or lethal injuries due to electric shock.

- Disconnect the product from voltage sources and make sure it cannot be reconnected before working on the device.
- Touch the cables of the PV array on the insulation only.
- Do not touch any parts of the substructure or frame of the PV array.
- Do not connect PV strings with ground faults to the inverter.
- Ensure that no voltage is present and wait five minutes before touching any parts of the PV system or the product.

**DANGER**

Danger to life due to electric shock in case of overvoltages and if surge protection is missing

Overvoltages (e.g. in the event of a flash of lightning) can be further conducted into the building and to other connected devices in the same network via the network cables or other data cables if there is no surge protection. Touching live parts and cables results in death or lethal injuries due to electric shock.

- Ensure that all devices in the same network are integrated in the existing overvoltage protection.
- When laying the network cable outdoors, ensure that there is suitable surge protection at the network cable transition from the product outdoors to the network inside the building.
- The Ethernet interface of the inverter is classified as "TNV-1" and offers protection against overvoltages of up to 1.5 kV.

**WARNING**

Danger to life due to fire or explosion

Despite careful construction, a fire or explosion may occur in electrical devices. Death or lethal injuries due to fire or flying debris can result.

- Wear suitable personal protective equipment for all work on the product.
- Do not mount the product in areas containing highly flammable materials or gases.
- Do not mount the product in potentially explosive atmospheres.
- Ensure that unauthorized persons have no access to the product.
- In case of error, only carry out corrective measures specified by SMA Solar Technology AG (for corrective measures see section "troubleshooting" in the detailed manual. If no corrective measures are specified, do not perform any actions on the product. Contact the Service.
## CAUTION

### Risk of burns from hot surfaces

The surface of the inverter can get very hot. Touching the surface can result in burns.
- Mount the inverter in such a way that it cannot be touched inadvertently.
- Do not touch hot surfaces.
- Wait 30 minutes for the surface to cool sufficiently.
- Observe the safety messages on the inverter.

## CAUTION

### Risk of injury due to weight of product

Injuries may result if the product is lifted incorrectly or dropped while being transported or when attaching it to or removing it from the wall mounting bracket.
- Transport and lift the product carefully. Take the weight of the product into account.
- Wear suitable personal protective equipment for all work on the product.

## NOTICE

### Damage to the enclosure seal in subfreezing conditions

If you open the product or disconnect the Power Unit and Connection Unit when temperatures are below freezing, the enclosure seals can be damaged. Moisture can penetrate the product and damage it.
- If a layer of ice has formed on the enclosure seal when temperatures are below freezing, remove it prior to opening the product (e.g. by melting the ice with warm air). Observe the applicable safety regulations.
- Do not disassemble the Power Unit and Connection Unit unless the ambient temperature is at least 0°C (32°F) and conditions are frost-free.

## NOTICE

### Damage to the product due to sand, dust and moisture ingress

Sand, dust and moisture penetration can damage the product and impair its functionality.
- Only open the product if the humidity is within the thresholds and the environment is free of sand and dust.
- Do not open the product during a dust storm or precipitation.
- Close tightly all enclosure openings.
- Only use listed rain-tight or liquid-tight conduit fittings to attach the conduits to the product.

## NOTICE

### Damage due to cleaning agents

The use of cleaning agents may cause damage to the product and its components.
- Clean the product and all its components only with a cloth moistened with clear water.
**NOTICE**

**Damage to the inverter due to electrostatic discharge**
Touching electronic components can cause damage to or destroy the inverter through electrostatic discharge.
- Ground yourself before touching any component.

**NOTICE**

**Destruction of the measuring device due to overvoltage**
- Only use measuring devices with a DC input voltage range of 600 V or higher.

**Electrical installations (for North America)**
All installations must conform with the laws, regulations, codes and standards applicable in the jurisdiction of installation (e.g. National Electrical Code® ANSI/NFPA 70 or Canadian Electrical Code® CSA-C22.1).
- Before connecting the product to the utility grid, contact your local grid operator. The electrical connection of the product must be carried out by qualified persons only.
- Ensure that the cables or conductors used for electrical connection are not damaged.
3 Scope of Delivery

<td>Type label</td>
</tr>
</tbody>
</table>

The type label clearly identifies the product. The type label must remain permanently attached to the product. You will find the following information on the type label:

- Device type (Model)
- Serial number (Serial No. or S/N)
- Date of manufacture
- Identification key (PIC) for registration in Sunny Portal
- Registration ID (RID) for registration in Sunny Portal
- WLAN password (WPA2-PSK) for the direct connection to the user interface of the inverter via WLAN
- Device-specific characteristics

</tr>
<tr>
<td></td>
<td>Together with the blue LED, this symbol indicates the status of the network connection.</td>
</tr>
</tbody>
</table>
### 4.3 Interfaces and Functions

The inverter can be equipped or retrofitted with the following interfaces and functions:

**User interface for monitoring and configuration**

The product is equipped as standard with an integrated webserver, which provides a user interface for configuring and monitoring the product. The product user interface can be called up via the web browser if there is an existing connection to an end device (e.g. computer, tablet PC or smartphone).

**SMA Speedwire**

The product is equipped with SMA Speedwire as standard. SMA Speedwire is a type of communication based on the Ethernet standard. SMA Speedwire is designed for a data transfer rate of 100 Mbps and enables optimum communication between Speedwire devices within systems.

Class 1 wiring methods are to be used for field wiring connection to the terminals of the communication interface.

**SMA Webconnect**

The inverter is equipped with a Webconnect function as standard. The Webconnect function enables direct data transmission between the inverter and Sunny Portal (online monitoring system from SMA).

There are two Sunny Portal versions: the classical Sunny Portal (https://www.sunnyportal.com) and the newly developed Sunny Portal powered by ennexOS (https://ennexOS.sunnyportal.com). Both systems differ in their supported functions. With an existing user account, you can log into both portals as well as into Sunny Design (system planning software from SMA).

In a Sunny Portal system, up to four inverters with Webconnect function can be displayed together. A communication product (e.g. SMA Data Manager) is required for systems with more than four inverters.

The system must be registered in the classic Sunny Portal if the inverter is integrated into a local network and connected to the Internet via this network. With this connection, you have the possibility to view the data online in real time.
If the inverter is connected to the Internet via the cellular network, you must register the system in Sunny Portal powered by ennexOS. The communication with the inverters is optimized with regard to the data volume and availability of the inverter. No data can be viewed in real time. Note that the inverter must be equipped with a firmware version ≥ 2.04.88.R for connection via the cellular network.

**WLAN**

The product is equipped with a WLAN interface as standard. The inverter is delivered with the WLAN interface activated as standard. If you do not want to use WLAN, you can deactivate the WLAN interface.

In addition, the product has a WPS function. The WPS function is for automatically connecting the product to a network (e.g. via router) and establish a direct connection between the product and an end device.

![i] Expanding the radio range in the WLAN network

In order to expand the radio range of the inverter in the WLAN network, you can install the Antenna Extension Kit accessory set in the inverter.

**Modbus**

The product is equipped with a Modbus interface. The Modbus interface is deactivated by default and must be configured as needed.

The Modbus interface of the supported SMA products is designed for industrial use – via SCADA systems, for example – and has the following tasks:

- Remote query of measured values
- Remote setting of operating parameters
- Setpoint specifications for system control

**Module slots**

The inverter is standard-equipped with two module slots. The module slots are located on the communication assembly and allow additional modules to be connected (e.g. SMA Sensor Module). The modules are available as accessories. The installation of two identical modules is not permissible.

**SMA RS485 Module**

The inverter can be retrofitted with the SMA RS485 Module.

By installing the SMA RS485 Module, the inverter is able to communicate with the energy meter of the SMA Revenue Grade Meter Kit.

Class 1 wiring methods are to be used for field wiring connection to the terminals of the communication interface.

**Antenna Extension Kit**

Within the WLAN network, the Antenna Extension Kit enables the radio range of the inverter to be upgraded (Information on assembly and connection see manual of the Antenna Extension Kit). The Antenna Extension Kit can be retrofitted.
SMA Sensor Module
The SMA Sensor Module has different interfaces for connecting various sensors (i.e. temperature sensor, irradiation sensor, anemometer or energy meter). The SMA Sensor Module converts the signals of the connected sensors and transmits them to the inverter. The SMA Sensor Module can be retrofitted.

SMA Cellular LTE Modem Kit
The inverter can be retrofitted with the SMA Cellular LTE Modem Kit.
The SMA Cellular LTE Modem Kit allows the direct data transmission between the inverter and the internet portal Sunny Portal via the cellular network as an alternative to data transmission via Ethernet or WLAN. In addition, the SMA Cellular LTE Modem Kit enables the communication between the inverter and the energy meter.
The SMA Cellular LTE Modem Kit transmits up to four times a day a limited amount of data to Sunny Portal. The standard term of the mobile data plan for the SMA Cellular LTE Modem Kit is five years. All costs are covered within the term. No additional costs will be incurred. You have the possibility to extend the term of the mobile data plan. For this purpose, contact SMA Solar Technology AG. By using the SMA Cellular LTE Modem Kits, a local network connection is not absolutely necessary. However, it is recommended to be able to view all information regarding the system in Sunny Portal.

Energy meters in accordance with ANSI C12.20
The inverter can be retrofitted with the SMA Revenue Grade Meter Kit that in accordance with ANSI C12.20 includes an energy meter.
The energy meter fulfills the accuracy class 0.5 in accordance with ANSI C12.20. The energy meter is a so called PV production meter intended to measure the generated energy of the inverter. The measured values of the energy meter can be used for billing purposes.

Grid Management Services
The inverter is a grid support interactive inverter.
The inverter was tested in accordance with the UL 1741 SA (2016-09-07) to be compliant with the source requirements documents of the states available at the time. For connecting the inverter to the utility grid, no additional grid monitoring equipment is necessary. A description of the tested functions and instructions on the activation and setting of functions can be found in the technical information "Grid Support Utility Interactive Inverters" at www.SMA-Solar.com.

PV Rapid Shutdown System Equipment
The inverter is a PV Rapid Shutdown System Equipment and performs the function of voltage reduction according to UL 1741 CRD PV Rapid Shutdown Systems 2015. When a rapid shutdown is triggered by disconnecting the utility grid, the inverter discharges independently on the AC side to ≤ 30 V within 30 seconds.
If a disconnection device is used in addition between the inverter and the PV array that disconnects the PV array in the case of a rapid shutdown, the inverter discharges independently on the DC side to ≤ 30 V within 30 seconds.
The electric discharge on the DC side is deactivated by default and must be activated manually after commissioning of the inverter via the user interface.
NOTICE - The inverter's Rapid Shutdown function is initiated by disconnecting the inverter from the AC grid voltage, for example, by opening the main PV system AC disconnect. The AC disconnect that serves as the Rapid Shutdown initiation device must be readily accessible and clearly marked in accordance with National Electrical Code®. The Rapid Shutdown status of the PV system will be indicated by the On/Off (Closed/Open) position of this AC disconnect. The Off (Open) position indicates that Rapid Shutdown has been initiated.

Parallel Operation of the DC Inputs A and B
The DC inputs A and B of the inverter can be operated in parallel and up to three strings can be connected to it in parallel. As a result, as opposed to normal operation, up to three strings can be connected directly to inverters with two DC inputs and up to four strings to inverters with three DC inputs. The inverter automatically detects the parallel operation of the DC inputs A and B.

Secure power supply operation
You can connect an external outlet and a switch to the inverter in order to activate the outlet. In case of a grid failure, the outlet supplies a load with current from the PV system. When the outlet is activated via the switch, the load is supplied with current from the PV system. The inverter automatically regulates the energy supply of the outlet depending on the solar irradiation on the PV system. When the outlet is activated and a load is supplied with current from the PV system, the inverter is disconnected from the utility grid and does not feed into the utility grid.

If the available accessory communication set for TS4-R module technology components (SMA Rooftop Communication Kit) is installed in the inverter, the secure power supply operation is no longer available. The Rooftop Communication Kit supports the Rapid Shutdown function. The AC circuit breaker in the system is simultaneously the Rapid Shutdown initiator. In the event of a grid failure or when operating the Rapid Shutdown initiator, the inverter is also disconnected from voltage sources on the DC side. Thus the supply of the outlet for secure power supply operation can no longer be guaranteed.

Do not connect loads that require a stable electricity supply to the outlet for secure power supply operation
Secure power supply operation must not be used for loads that require a stable electricity supply. The power available during secure power supply operation depends on the solar irradiation on the PV system. Therefore, power output can fluctuate considerably depending on the weather or may not be available at all.

- Do not connect loads to the outlet for secure power supply operation if they are dependent on a stable electricity supply for reliable operation.

Multifunction Relay
The inverter is equipped with a multifunction relay as standard. The multifunction relay is an interface that can be configured for the operating mode used by a particular system.

String-failure detection
The self-learning string failure detection identifies to which of the three inverter DC inputs the strings are connected. The self-learning string failure detection identifies if the connected string is inoperable and is no longer contributing to the energy yield (e.g. due to damages such as a cable break) and monitors the input to which the defective string is connected. If the error persists, an
event will be reported at the latest one day after the detection of the defective string. This prevents partial failures of the PV array from being undetected for a long time and which will result in yield losses. The self-learning string failure detections automatically identifies if a string has been repaired and resets the event. If the defective string should no longer be connected, the event must be reset manually.

**Arc-Fault Circuit Interrupter (AFCI)**

In accordance with the *National Electrical Code®*, the inverter has a system for DC arc fault detection and interruption. The arc-fault circuit interrupter is listed in accordance with UL 1699B Ed. 1. A detected electric arc causes the inverter to interrupt feed-in operation; in order to restart feed-in operation, the feed-in operation must be activated manually. If the installation conditions allow it, you can deactivate the arc-fault circuit interrupter.

**SMA Smart Connected**

SMA Smart Connected is the free monitoring of the inverter via the SMA Sunny Portal. Thanks to SMA Smart Connected, the PV system operator and qualified person will be informed automatically and proactively about inverter events that occur.

SMA Smart Connected is activated during registration in Sunny Portal. In order to use SMA Smart Connected, it is necessary that the inverter is permanently connected to Sunny Portal and the data of the PV system operator and qualified person is stored in Sunny Portal and up-to-date.

### 4.4 LED Signals

The LEDs indicate the operating state of the inverter.

<table>
<thead>
<tr>

5 Mounting

5.1 Requirements for Mounting

Requirements for the Mounting Location:

⚠️ WARNING

Danger to life due to fire or explosion
Despite careful construction, electrical devices can cause fires.
- Do not mount the product in areas containing highly flammable materials or gases.
- Do not mount the product in potentially explosive atmospheres.

☐ A solid support surface must be available (e.g. concrete or masonry, free-standing constructions). When mounted on drywall or similar materials, the inverter emits audible vibrations during operation which could be perceived as annoying.

☐ The installation site can be exposed to direct solar irradiation. There is, however, the possibility that the product reduces its power output to avoid overheating due to high temperatures.

☐ When using the SMA Cellular LTE Modem Kit, the installation site should not be located in the basement. The data transmission during basement installation can be restricted due to an insufficient connection quality.

☐ The mounting location should be freely and safely accessible at all times without the need for any auxiliary equipment (such as scaffolding or lifting platforms). Non-fulfillment of these criteria may restrict servicing.

☐ The DC load-break switch of the product must always be freely accessible.

☐ All ambient conditions must be met (see Section 10, page 65).

Permitted and prohibited mounting positions:

☐ The product may only be mounted in a permitted position. This will ensure that no moisture can penetrate the product.

☐ The product should be mounted in such way that display messages and LED signals can be read without difficulty.

Figure 3: Permitted and prohibited mounting positions

☐ Do not mount multiple inverters directly above one another.
SMA Solar Technology AG

5 Mounting

Sunny Boy 7.0-US / 7.7-US

Figure 4: Permissible and impermissible mounting positions of multiple inverters
Dimensions for mounting:

Figure 5: Position of the anchoring points (Dimensions in mm (in))
**Recommended Clearances:**
To guarantee optimal operation and adequate heat dissipation for the inverter as well as a good connection quality when using the SMA Cellular LTE Modem Kit, the following requirements for clearances should be observed. This will prevent the inverter power output from being reduced due to excessive temperatures. However, smaller clearances are permitted without causing any risk.

* Prescribed clearances in accordance with the *National Electrical Code®* or *Canadian Electrical Code® CSA C22.1*

Under certain conditions, the *National Electrical Code®* or the *Canadian Electrical Code® CSA C22.1* specify greater clearances.

- Ensure that the prescribed clearances in accordance with the *National Electrical Code®* or *Canadian Electrical Code® CSA C22.1* are adhered to.

☐ Maintain the recommended clearances to walls as well as to other inverters or objects.
☐ If multiple inverters are mounted in areas with high ambient temperatures, increase the clearances between the inverters and ensure sufficient fresh-air supply.

---

![Diagram](image-url)

Figure 6: Recommended clearances (Dimensions in mm [in])
5.2 Mounting the Inverter

Additionally required mounting material (not included in the scope of delivery):

- Three screws suitable for the support surface (diameter: 8 mm (5/16 in))
- Three washers suitable for the screws
- Where necessary, 3 screw anchors suitable for the support surface and the screws
- To secure the inverter against theft: one padlock suitable for outdoor use
- Padlock dimensions:
  - Diameter of the shackle: 8 mm to 10 mm (0.31 in to 0.39 in)
  - Width of the shackle (inner dimension): 30 mm to 40 mm (1.18 in to 1.57 in)
  - Height of the shackle (inner dimension): 30 mm to 40 mm (1.18 in to 1.57 in)

---

**CAUTION**

**Risk of injury due to weight of product**

Injuries may result if the product is lifted incorrectly or dropped while being transported or when attaching it to or removing it from the wall mounting bracket.

- Transport and lift the product carefully. Take the weight of the product into account.
- Wear suitable personal protective equipment for all work on the product.

---

**The Connection Unit and Power Unit can be disconnected from one another to make mounting easier**

If the local conditions make it difficult to mount the entire inverter, you can disconnect the Connection Unit and Power Unit from each other if the ambient temperature is at least 0°C (32°F) and there is no frost. This way, you can transport each enclosure part and also attach to the wall mounting bracket individually. Then, during assembly, both enclosure parts must be joined again. A detailed description for how to disconnect the Connection Unit and Power Unit from each other and to individually mount them to the wall mounting bracket can be found on the Internet under www.SMA-Solar.com.

**Procedure:**

1. **CAUTION**

**Risk of injury due to damaged cables**

There may be power cables or other supply lines (e.g. gas or water) routed in the wall.
- Ensure that no lines are laid in the wall which could be damaged when drilling holes.
2. Align the wall mounting bracket horizontally on the wall and use it to mark the position of the drill holes. Here, use at least one hole each, to the right and left, and the hole at the bottom center.

3. Set the wall mounting bracket aside and drill the marked holes.
4. Insert screw anchors into the drill holes if the support surface requires them.
5. Secure the wall mounting bracket horizontally using screws and washers.
6. Hook the inverter into the wall mounting bracket. Here, the lugs on the rear side of the Power Unit must be hooked into the upper recesses and the lugs in the Connection Unit into the lower recesses in the wall mounting bracket.

7. Check whether the inverter is securely in place.
   If the Connection Unit can be moved forward, the lugs on the rear side of the Connection Unit are not hooked into the lower recesses in the wall mounting bracket. Remove the inverter from the wall mounting bracket and hook it in again.
   Once the Connection Unit cannot be moved forward, the inverter is securely in place.
8. Secure the inverter to the wall mounting bracket. To do this, insert the screw M5x60 through the hole on the left side of the Power Unit using a Torx screwdriver (TX 25) and tighten it (TX25, torque: 1.7 Nm ± 0.3 Nm (15.06 in-lb ± 2.65 in-lb)).

9. If the inverter is to be protected against theft, attach a padlock:
5 Mounting

- To do this, guide the shackle of the padlock through the provided hole on the left side of the Power Unit and close the shackle.

- Keep the key of the padlock in a safe place.

### 6.2 AC Connection

#### 6.2.1 Requirements for the AC Connection

**Additionally required material (not included in the scope of delivery):**

- Conduits (trade size: 21 mm (0.75 in) or smaller with suitable reducer bush)
- UL-listed raintight or liquidtight conduit fittings (trade size: 21 mm (0.75 in) or smaller with suitable reducer bush)

**Requirements on the AC conductors:**

- The maximum permitted temperature of the terminal block for AC connection of 105°C (221°F) must be observed.
- The conductors with regards to its ampacity, rated temperatures, operating conditions and its power loss must be made in accordance with the local standards and the *National Electrical Code*® ANSI/NFPA 70 or the *Canadian Electrical Code*® CSA C22.1.
- Conductor type: copper wire
- Maximum permissible temperature for SB7.0-1SP-US-40 and SB7.7-1SP-US-40: +90°C (+194°F)
- The conductors must be made of solid wire, stranded wire or fine stranded wire. When using fine stranded wire, bootlace ferrules must be used.
- Conductor cross-section: 4 mm² to 16 mm² (12 AWG to 6 AWG)

**Load-break switch and cable protection:**

- In PV systems with multiple inverters, protect each inverter with its own overcurrent protective device. Observe the maximum permissible fuse protection (see Section 10 "Technical Data", page 65). This will prevent residual voltage from being present at the corresponding conductor after disconnection.
- The load-break switch or circuit breaker must be listed (see *National Electrical Code*® ANSI/NFPA 70) or Canadian Electrical Code® CSA C22.1).
- Loads installed between the inverter and the overcurrent protective device must be fused separately.
- The overcurrent protective device for the AC output circuit is to be provided by others.
Compatible grid configurations:
The connection procedure will vary, depending on the grid configuration; the country data set may have to be set. The following table provides an overview of the compatible grid configurations, which conductors have to be connected to the inverter to comply with the grid configuration and, if applicable, which country data set of the inverter has to be set. As standard, the inverter is meant for connection to a utility grid with a 208 V wye connection or a 240 V split-phase system, and the country data set UL1741/2016/120 is factory-set.

<table>

6.2.2 Connecting the Inverter to the Utility Grid

Requirements:
- All electrical installations must be carried out in accordance with the local standards and the National Electrical Code® ANSI/NFPA 70 or the Canadian Electrical Code® CSA C22.1.
- The connection requirements of the grid operator must be met.
- The grid voltage must be within the permissible range. The exact operating range of the inverter is specified in the operating parameters.

Procedure:
1. Disconnect the AC circuit breaker and secure it against reconnection.
2. Ensure that the DC load-break switch of the inverter is in the O position.

3. If the enclosure lid of the Connection Unit is mounted, remove it as follows:
   - Unscrew all six screws (TX 25) and carefully remove the enclosure lid towards the front. While doing so, note that the assembly on the enclosure lid of the Connection Unit and the communication assembly in the Connection Unit are connected via a ribbon cable. During the first installation, the ribbon cable is to be connected only to the LED assembly on the enclosure lid of the Connection Unit.
- Disconnect the ribbon cable from the socket on the communication assembly. During the first installation, the ribbon cable is to be connected only to the assembly on the enclosure lid of the Connection Unit.

4. Remove the adhesive tape from the enclosure opening for the AC connection.
5. Insert the conduit fitting into the opening and tighten from the inside using the counter nut.
6. Attach the conduit to the conduit fitting.
7. Guide the conductors from the conduit into the inverter. In the process, install the conductors in the inverter such that they do not come into contact with communication cables, the cable of the LED assembly or other live conductors. Lay the conductors as a loop if they are too long.
8. Connect the equipment grounding conductor of the utility grid to the equipment grounding terminal:
   - Strip the insulation of the equipment grounding conductor by 18 mm (0.71 in).
   - Insert the screw through the spring washer, the clamping bracket and the washer.
   - Guide the equipment grounding conductor between the washer and clamping bracket and tighten the screw (TX 25) (torque: 6 Nm ± 0.3 Nm (53.10 in-lb ± 2.65 in-lb)).
9. Plug the terminal block for the AC connection in the **AC-out** slot in the inverter, and tighten it with a flat-blade screwdriver (blade width: 4 mm (\( \frac{5}{32} \) in)) (torque: 0.3 Nm (2.65 in-lb)).
10. Ensure that the terminal block is securely in place and the screws are tightened.
11. Strip off the conductor insulation of L1, L2 and, if applicable, N by 18 mm (0.71 in) each.
12. In the case of fine stranded wire, provide the conductors with a bootlace ferrule.
13. **Connection of conductors of finely stranded wire**

To connect conductors made of finely stranded wire, each terminal point must be opened.

- First insert the connector into the terminal point all the way to the lock (round opening). Then insert a flat-blade screwdriver (blade: 4 mm (\(\frac{5}{32}\) in)) as far as it can go into the actuation shaft (rectangular opening). Hereby the lock opens and the conductor can be placed into the terminal point as far as possible. After the connection has been made, the flat-blade screwdriver must be pulled out of the actuation shaft.

14. **WARNING**

**Fire hazard due to faulty conductor connection**

If the conductors are inserted into the actuation shafts (right-angled openings), a fire may occur during inverter commissioning.

15. Connect the conductors to the terminal block for the AC connection:

- If there is a neutral conductor, connect the neutral conductor to the terminal block in accordance with the labeling. Insert the conductor into the corresponding terminal point (round opening) up to the stop.

- Connect L1 and L2 to the terminal block in accordance with the labeling. Insert each conductor into the corresponding terminal point (round opening) up to the stop.

16. Ensure the conductors are plugged into the terminal points (round openings) as far as is will go and not into the actuation shafts (rectangular openings).

17. Ensure that the terminal points are allocated to the correct conductors.

18. Ensure that the conductors are plugged completely into the terminal points up to their insulation.
6.3 Connecting the Network Cables

⚠️ DANGER

Danger to life due to electric shock in case of overvoltages and if surge protection is missing

Overvoltages (e.g. in the event of a flash of lightning) can be further conducted into the building and to other connected devices in the same network via the network cables or other data cables if there is no surge protection. Touching live parts and cables results in death or lethal injuries due to electric shock.

- Ensure that all devices in the same network are integrated in the existing overvoltage protection.
- When laying the network cable outdoors, ensure that there is suitable surge protection at the network cable transition from the product outdoors to the network inside the building.
- The Ethernet interface of the inverter is classified as "TNV-1" and offers protection against overvoltages of up to 1.5 kV.

Additionally required material (not included in the scope of delivery):

- One to two network cables
- Where required: Field-assembly RJ45 connector.

Network cable requirements:
The cable length and quality affect the quality of the signal. Observe the following cable requirements.

- Cable type: 100BaseTx
- Cable category: Cat5, Cat5e or higher
- Plug type: RJ45 of Cat5, Cat5e or higher
- Shielding: SF/UTP, S/UTP, SF/FTP or S/FTP
- Number of insulated conductor pairs and insulated conductor cross-section: at least 2 x 2 x 0.22 mm² (2 x 2 x 24 AWG)
- Maximum cable length between two nodes when using patch cables: 50 m (164 ft)
- Maximum cable length between two nodes when using installation cables: 100 m (328 ft)
- UV-resistant for outdoor use

Procedure:

1. ⚠️ DANGER

Danger to life due to electric shock

- Disconnect the inverter from all voltage sources (see Section 8, page 61).

2. Remove the sealing plugs from the network connection opening on the inverter.
3. Insert the conduit fitting into the opening and tighten from the inside using the counter nut.
4. Attach the conduit to the conduit fitting.
5. Lead one end of each network cable from the conduit into the inverter.
6. Put the network plug of each cable into one of the network sockets of the communication assembly.

7. Ensure that the network connector is securely in place by pulling slightly on each cable.
8. Connect the other end of the network cable to the energy meter.

### 6.4 Connecting the Multifunction Relay

#### 6.4.1 Procedure for connecting the multifunction relay

</tbody>
</table>
Using the Multifunction Relay as a Fault Indicator Contact

You can use the multifunction relay as a fault indicator contact and have an error or smooth operation of the inverter displayed or signaled via a suitable display device. You can connect multiple inverters to one fault indicator or operation indicator, as needed.

Figure 9: Circuit diagram with multiple inverters for connection to an operation indicator and circuit diagram for connection to a fault indicator (example)
Controlling loads via the multifunction relay or charging batteries depending on the power production of the PV system

The multifunction relay can control loads or charge batteries power-dependently. To enable this function, you must connect a contactor (K1) to the multifunction relay. The contactor (K1) switches the operating current for the load on or off. If you want batteries to be charged depending on the available power, the contactor activates or deactivates the charging of the batteries.

Figure 10: Wiring diagram for connection for controlling a load or for the power-dependent charging of the batteries

max. 30 V\text{dc}
**Reporting the switching status of the grid relay**

The multifunction relay can trip a signal to the grid operator as soon as the inverter connects to the utility grid. To enable this function, the multifunction relays of all inverters must be connected in parallel.

![Wiring diagram for signaling the switching status of the grid relay](image)

**6.4.4 Connection to the Multifunction Relay**

Additionally required material (not included in the scope of delivery):

- Conduits: 21 mm (0.75 in) or smaller with a proper reducing bush
- Rain-tight conduit fittings for wet locations complying with UL 514B: 21 mm (0.75 in) or smaller with a proper reducing bush
Requirements:
- The technical requirements of the multifunction relay must be met (see Section 10 "Technical Data", page 65).
- All electrical installations must be carried out in accordance with the local standards and the National Electrical Code® ANSI/NFPA 70 or the Canadian Electrical Code® CSA C22.1.

Requirements on the conductors:
- Conductor cross-section: 0.2 mm² to 1.5 mm² (24 AWG to 16 AWG)
- The conductor type and wiring method must be appropriate for the application and location.

Procedure:

1. **DANGER**
   Danger to life due to high voltages
   - Ensure that the inverter is disconnected from all voltage sources (see Section 8, page 61).

2. Remove the sealing plug from the enclosure opening on the multifunction relay.
3. Insert the conduit fitting into the opening and tighten from the inside using the counter nut.
4. Attach the conduit to the conduit fitting.
5. Guide the conductors from the conduit into the inverter.
6. Strip off the conductor insulation by max. 9 mm (0.35 in).
7. Connect the conductors to the 3-pole terminal block according to the circuit diagram, depending on the operating mode (see Section 6.4.3, page 37). Ensure that the conductors are plugged completely into the terminal points (round openings) up to their insulation.
8. Stick the terminal block into the MFR slot on the communication assembly in the inverter.

9. Ensure that the terminal block is securely in place.
10. Ensure that all conductors are correctly connected.
11. Ensure that the conductors sit securely in the terminal points. Tip: To release the conductors from the terminal block, open the terminal points using a suitable tool.
6.5 Connecting the Switch and Outlet for Secure Power Supply Operation

Neutral and grounding conductor of output for secure power supply permanently connected
The inverter’s output for secure power supply includes a permanent connection between neutral and grounding conductor, which cannot be disconnected.

Requirements:
- The technical requirements must be met for connecting the switch and outlet for secure power supply operation (see Section 10 “Technical Data”, page 65).
- All electrical installations must be carried out in accordance with the local standards and the National Electrical Code® ANSI/NFPA 70 or the Canadian Electrical Code® CSA C22.1.

Residual-current device:
- SMA Solar Technology AG recommends to install a residual-current device (type A) between the inverter’s output for secure power supply and the outlet for secure power supply operation, which trips at a residual current of 30 mA. Observe all locally applicable standards and directives when doing so.

Additionally required material (not included in the scope of delivery):
- One standard outlet
- One standard switch (e.g. light switch)
- Conduits (trade size: 21 mm (0.75 in) or smaller with suitable reducer bush)
- UL-listed raintight or liquidtight conduit fittings (trade size: 21 mm (0.75 in) or smaller with suitable reducer bush)

Procedure:
- Connect the outlet for secure power supply operation.
- Connect the switch for secure power supply operation.

Connect the outlet for secure power supply operation

Requirements on the conductors:
- The conductors with regards to its ampacity, rated temperatures, operating conditions and its power loss must be made in accordance with the local standards and the National Electrical Code® ANSI/NFPA 70 or the Canadian Electrical Code® CSA C22.1.
- Conductor type: copper wire
- The conductors must be made of solid wire, stranded wire or fine stranded wire. When using fine stranded wire, bootlace ferrules must be used.
- Conductor cross-section: 2.5 mm² to 4 mm² (14 AWG to 12 AWG)
- Maximum length of conductors: 10 m (33 ft)
Procedure:

1. **DANGER**

   **Danger to life due to high voltages**
   - Ensure that the inverter is disconnected from all voltage sources (see Section 8, page 61).

2. Remove the sealing plug from the enclosure opening for connecting the outlet for secure power supply operation.

3. Insert the conduit fitting into the opening and tighten from the inside using the counter nut.

4. Attach the conduit to the conduit fitting.

5. Guide the conductors into the inverter.

6. Connect the equipment grounding conductor of the outlet for secure power supply operation to an equipment grounding terminal:
   - Strip the insulation of the equipment grounding conductor by 18 mm (0.71 in).
   - Insert the screw through the spring washer, the clamping bracket and the washer.

   - Guide the equipment grounding conductor between the washer and clamping bracket and tighten the screw (TX 25) (torque: 6 Nm ± 0.3 Nm (53.10 in-lb ± 2.65 in-lb)).

7. Plug the terminal block for connecting the outlet for secure power supply operation into the SPS slot in the inverter and tighten it with a flat-blade screwdriver (blade width: 4 mm (5/32 in)).

8. Ensure that the terminal block is securely in place.

9. Strip off the conductor insulation by max. 15 mm (0.59 in).

10. In the case of finely stranded wire, provide the conductors L and N with a bootlace ferrule.
11. **Connection of conductors of finely stranded wire**

To connect conductors made of finely stranded wire, each terminal point must be opened.

- First insert the connector into the terminal point all the way to the lock (round opening). Then insert a flat-blade screwdriver (blade: 3.2 mm (¼ in)) as far as it can go into the actuation shaft (rectangular opening). Hereby the lock opens and the conductor can be placed into the terminal point as far as possible. After the connection has been made, the flat-blade screwdriver must be pulled out of the actuation shaft.

12. **WARNING**

**Fire hazard due to faulty conductor connection**

If the conductors are inserted into the actuation shafts (right-angled openings), a fire may occur during inverter commissioning.

13. Connect the conductors L and N to the terminal block in accordance with the labeling. Insert each conductor into the corresponding terminal point (round opening) up to the stop.

14. Ensure the conductors are plugged into the terminal points (round openings) as far as is will go and not into the actuation shafts (rectangular openings).

15. Ensure that the terminal points are allocated to the correct conductors.

16. Ensure that the conductors are plugged completely into the terminal points up to their insulation.

17. Install outlet in desired position (e.g. next to the inverter or as switch/outlet combination optionally at short distance from the inverter (to max. 10 m (393.7 in))).

18. Connect the other end of the cable using it directly as energy supply to the outlet.
Connect the switch for secure power supply operation

Requirements on the conductors:
- Conductor cross-section: 0.2 mm² to 2.5 mm² (24 AWG to 14 AWG)
- The conductor type and wiring method must be appropriate for the application and location.
- Maximum length of conductors: 10 m (393.7 in)

Procedure:
1. Remove the sealing plug from the opening for connecting the switch for secure power supply operation.
2. Insert the conduit fitting into the opening and tighten from the inside using the counter nut.
3. Attach the conduit to the conduit fitting.
4. Guide the conductors into the inverter.
5. Strip off the conductor insulation by min. 6 mm (0.24 in) to max. 10 mm (0.39 in).
6. Connect the conductors to the 2-pole terminal blocks. Ensure that the conductors are plugged completely into the terminal points up to their insulation.
7. Stick the terminal block into the SPS slot on the communication assembly in the inverter.
8. Ensure that the terminal block is securely in place.
9. Ensure that all conductors are correctly connected.
10. Ensure that the conductors sit securely in the terminal points. Tip: To release the conductors from the terminal block, open the terminal points using a suitable tool.
11. Install switch in desired position (e.g. next to the inverter or as switch/outlet combination optionally at short distance from the inverter (to max. 10 m (393.7 in))
12. Connect the other end of the cable directly to the switch.
6.6 DC Connection

6.6.1 Requirements for the DC Connection

Connection options:
One string each can be connected to each DC input of the inverter during normal operation. The DC inputs A and B can however be operated in parallel, and thus up to three strings can be connected to inverters with two DC inputs and up to four strings to inverters with three DC inputs. The following device types have two MPP trackers and therefore two DC inputs (A and B):

- Sunny Boy 3.0-US / 3.8-US
- Sunny Boy 5.0-US / 6.0-US / 7.0-US / 7.7-US

![Diagram of Sunny Boy 3.0-US / 3.8-US](image1)

![Diagram of Sunny Boy 5.0-US / 6.0-US / 7.0-US / 7.7-US](image2)

Figure 12: Connection overview for normal operation

The following device types have three MPP trackers and therefore three DC inputs (A, B, and C):

- Sunny Boy 3.0-US / 3.8-US
- Sunny Boy 5.0-US / 6.0-US / 7.0-US / 7.7-US

![Diagram of Sunny Boy 3.0-US / 3.8-US](image3)

![Diagram of Sunny Boy 5.0-US / 6.0-US / 7.0-US / 7.7-US](image4)

Figure 13: Connection overview for parallel connection of the DC inputs A and B
Requirements for the PV modules per input:
- All PV modules should be of the same type.
- All PV modules should be aligned and tilted identically.
- If inputs A and B are connected in parallel, the PV modules of inputs A and B should be identically aligned and the same number of PV modules connected in series must be connected to all strings of inputs A and B.
- The maximum inverter system voltages permitted may not be exceeded (see Section 10 "Technical Data", page 65).
- The maximum short-circuit current may not be exceeded (see Section 10 "Technical Data", page 65).

Additionally required material (not included in the scope of delivery):
- Conduits (trade size: 21 mm (0.75 in) or smaller with suitable reducer bush)
- UL-listed raintight or liquidtight conduit fittings (trade size: 21 mm (0.75 in) or smaller with suitable reducer bush)

Requirements on the DC conductors:
- The conductors with regards to its ampacity, rated temperatures, operating conditions and its power loss must be made in accordance with the local standards and the National Electrical Code® ANSI/NFPA 70 or the Canadian Electrical Code® CSA C22.1.
- The DC terminal block temperature rating is +90°C (+194°F).
- Conductor type: copper wire
- Maximum permissible temperature: 75°C (+167°F) or 90°C (194°F)
- The conductors must be made of solid wire, stranded wire or fine stranded wire. When using fine stranded wire, bootstrap ferrules must be used.
- Conductor cross-section: 2.5 mm² to 10 mm² (14 AWG to 8 AWG)

6.6.2 Connecting the PV Array

**NOTICE**

Damage to the inverter due to ground fault on DC side during operation
Due to the transformerless topology of the product, the occurrence of ground faults on DC side during operation can lead to irreparable damage. Damages to the product due to a faulty or damaged DC installation are not covered by warranty. The product is equipped with a protective device that checks whether a ground fault is present during the starting sequence. The product is not protected during operation.
- Ensure that the DC installation is carried out correctly and no ground fault occurs during operation.
Requirements:

- The grounding of the PV system must be executed as per the specifications of the National Electrical Code® ANSI/NFPA 70 and is the responsibility of the installer.
- All electrical installations must be carried out in accordance with the local standards and the National Electrical Code® ANSI/NFPA 70 or the Canadian Electrical Code® CSA C22.1.

Procedure:

1. **DANGER**

   **Danger to life due to high voltages**
   
   When exposed to sunlight, the PV array generates dangerous DC voltage which is present in the DC conductors. Touching the DC conductors can lead to lethal electric shocks.
   
   - If an external DC disconnecting switch is available, open the external DC disconnecting switch.
   - Ensure that the DC load-break switch on the inverter is in the **O** position.
   - Ensure that there is no voltage on the DC inputs of the inverter.

2. Remove the adhesive tape from the enclosure opening for the DC connection and, if other enclosure openings are to be used, take the sealing plugs out of these enclosure openings.
3. Insert the conduit fitting into the opening and tighten from the inside using the counter nut.
4. Attach the conduit to the conduit fitting.
5. Guide the conductors from the conduit into the inverter. In the process, lay the conductors in the inverter such that they do not come into contact with the communication assembly.
6. Connect each equipment grounding conductor of the PV array to an equipment grounding terminal:
   
   - Strip the insulation of the equipment grounding conductor by 18 mm (0.71 in).
   - Insert the screw through the spring washer, the clamping bracket and the washer.
   - Guide the equipment grounding conductor between the washer and clamping bracket and tighten the screw (TX 25) (torque: 6 Nm ± 0.3 Nm (53.10 in-lb ± 2.65 in-lb)). Here, the equipment grounding conductor must have contact with an inner edge of the clamping bracket.
7. Plug the terminal block for the DC connection into the DC-in slot in the inverter.

8. **DANGER**

**Danger to life due to electric arc**

The terminal block must be fastened to the slot with two screws. If the terminal block is not correctly mounted and comes out of the slot, an electric arc can form. An electric arc can cause life-threatening burns and can cause fire.

- Mount the terminal block using the two screws as described in the following.

9. Tighten the screws of the terminal block using a flat-blade screwdriver (blade width: 3.5 mm (0.14 in)) (torque: 0.3 Nm (2.65 in-lb)).

10. Ensure that the terminal block is securely in place and the screws are tightened.

11. Strip off the conductor insulation by 18 mm (0.71 in).

12. In the case of fine stranded wire, provide each conductor with a bootlace ferrule.

13. **Connection of conductors of finely stranded wire**

To connect conductors made of finely stranded wire, each terminal point must be opened.

- First insert the connector into the terminal point all the way to the lock (round opening). Then insert a flat-blade screwdriver (blade: 3.5 mm (0.14 in)) as far as it can go into the actuation shaft (rectangular opening). Hereby the lock opens and the conductor can be placed into the terminal point as far as possible. After the connection has been made, the flat-blade screwdriver must be pulled out of the actuation shaft.
14. **WARNING**

**Fire hazard due to faulty conductor connection**

If the conductors are inserted into the actuation shafts (right-angled openings), a fire may occur during inverter commissioning.

- Connect the conductors to the terminal block as described in the following.

15. Connect the conductors to the terminal block in accordance with the labeling. Insert each conductor into the corresponding terminal point (round opening) up to the stop. Always connect the positive terminal and the negative terminal of a string to the same input, and keep in mind that the terminals C+ and C- of inverters with two DC inputs must not be assigned.

16. Ensure the conductors are plugged into the terminal points (round openings) as far as is will go and not into the actuation shafts (rectangular openings).

17. Ensure that the terminal points are allocated to the correct conductors.

18. Ensure that the conductors are plugged completely into the terminal points up to their insulation.
## 7 Commissioning

### 7.1 Commissioning Procedure

This section describes the commissioning procedure and gives an overview of the steps you must perform in the prescribed order.

<table>
<thead>
<tr>
<th>Procedure</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Commission the inverter.</td>
<td>see section 7.2, page 51</td>
</tr>
<tr>
<td>2. Establish a connection to the user interface of the inverter.</td>
<td>see section 7.3, page 53</td>
</tr>
<tr>
<td>There are various connection options to choose from for this:</td>
<td></td>
</tr>
<tr>
<td>• Direct connection via WLAN</td>
<td></td>
</tr>
<tr>
<td>• Direct connection via Ethernet</td>
<td></td>
</tr>
<tr>
<td>• Connection via WLAN in the local network</td>
<td></td>
</tr>
<tr>
<td>• Connection via Ethernet in the local network</td>
<td></td>
</tr>
<tr>
<td>3. Log into the user interface.</td>
<td>see section 7.4, page 57</td>
</tr>
<tr>
<td>4. Select the inverter configuration option. Please note that the SMA Grid Guard code for changing the grid-relevant parameters must be available after completion of the first ten feed-in hours or installation assistant (see &quot;Application for the SMA Grid Guard code&quot; available at <a href="http://www.SMA-Solar.com">www.SMA-Solar.com</a>).</td>
<td>see section 7.5, page 58</td>

### 7.2 Commissioning the Inverter

**Requirements:**

- The AC circuit breaker must be correctly rated and mounted.
- A means of disconnecting the inverter from the PV array must be present.
- The inverter must be correctly mounted.
- All conductors must be correctly connected.
- Unused enclosure openings must be sealed tightly with sealing plugs.
Procedure:

1. Lead the enclosure lid to the Connection Unit and plug the ribbon cable into the socket on the communication assembly.

2. Ensure that the ribbon cable is securely plugged into the sockets at both ends.
3. Position the enclosure lid of the Connection Unit on the enclosure and tighten all 6 screws crosswise (TX 2.5, torque: 3 Nm ± 0.3 Nm (26.55 in-lb ± 2.65 in-lb)).
4. Turn the DC load-break switch of the inverter to position I.

5. Switch on the AC circuit breaker.
   - ✓ All three LEDs light up and the display is illuminated. The start-up phase begins.
   - ✓ After approximately 90 seconds, all three LEDs will go out again and the display will show a succession of different messages with inverter data.
   - ✓ Depending on the available power, the green LED pulses or is continuously illuminated. The inverter is feeding in.
6. If the LEDs do not start to glow and the display remains dark, the ribbon cable between the assembly in the enclosure lid and the communication assembly in the inverter is most likely not properly plugged in. Ensure that the ribbon cable is securely plugged into the sockets at both ends.
7. If the green LED is still flashing, the conditions for activating feed-in operation are not yet met. As soon as the conditions for feed-in operation are met, the inverter starts with feed-in operation and, depending on the available power, the green LED will light up continuously or it will pulse.
8. If the red LED lights up, an error has occurred. Rectify the error (for information regarding troubleshooting see the user manual under www.SMA-Solar.com).
7.3 Establishing a connection to the user interface

7.3.1 Establishing a Direct Connection via Ethernet

Requirements:

- The product must be commissioned.
- An end device (e.g. computer) with an Ethernet interface must be available.
- The product must be connected directly to the end device.
- The respective latest version of one of the following web browsers must be installed: Chrome, Edge, Firefox, Internet Explorer or Safari.
- The SMA Grid Guard code of the Installer must be available for the changing of grid-relevant settings after completion of the first ten feed-in hours or installation assistant (see "Application for SMA Grid Guard Code" at www.SMA-Solar.com).

Procedure:

1. Tap on the enclosure lid of the Connection Unit and continue to switch up to the message E-IP: 169.254.xxx.xxx.
2. Read off the displayed IP address for the direct connection via Ethernet and either remember it or write it down.
3. Open the web browser of your device, enter the IP address in the address line of the web browser and press the enter key.

4. **Web browser signals a security vulnerability**

   After the IP address has been confirmed by pressing the enter key, a message might appear indicating that the connection to the user interface of the inverter is not secure. SMA Solar Technology AG guarantees that calling up the user interface is secure.
   - Continue loading the user interface.

- The login page of the user interface opens.

7.3.2 Establishing a direct connection via WLAN

Requirements:

- The product must be commissioned.
- An end device (e.g. computer, tablet PC or smartphone) must be available.
- The respective latest version of one of the following web browsers must be installed: Chrome, Edge, Firefox, Internet Explorer or Safari.
- JavaScript must be enabled in the web browser of the end device.
- The SMA Grid Guard code of the Installer must be available for the changing of grid-relevant settings after completion of the first ten feed-in hours or installation assistant (see "Application for SMA Grid Guard Code" at www.SMA-Solar.com).
SSID, IP address and necessary passwords

- SSID in WLAN: SMA[serial number] (e.g. SMA0123456789)
- Standard WLAN password (usable until completion of the configuration by means of the installation assistant or prior to the end of the first ten feed-in hours): SMA12345
- Device-specific WLAN password (usable for initial configuration to completion of the first ten feed-in hours); see WPA2-PSK on the type label of the inverter or on the back of the manual included in the delivery
- Standard IP address for a direct connection via WLAN outside of a local network: 192.168.12.3

Importing and exporting files with end devices having an iOS operating system is not possible.

For technical reasons, importing and exporting files (e.g. importing an inverter configuration, saving the current inverter configuration or exporting events and parameters) is not possible with mobile end devices having an iOS operating system.

- Use an end device that does not have an iOS operating system for importing and exporting files.

The procedure can be different depending on the end devices. If the procedure described does not apply to your end device, establish the direct connection via WLAN as described in the manual of your end device.

Procedure:

1. If your end device has a WPS function:
   - Activate the WPS function on the inverter. To do this, tap twice on the enclosure lid of the Connection Unit.
     - The blue LED flashes quickly for approx. two minutes. The WPS function is active during this time.
   - Activate the WPS on your end device.
     - The connection with your end device will be established automatically. It can take up to 20 seconds for this connection to be established.

2. If your end device has not a WPS function:
   - Search for WLAN networks with your end device.
   - Select the SSID of the inverter SMA[serial number] in the list with the found WLAN networks.
   - Enter the inverter WLAN password. Within the first ten feed-in hours and prior to completing the configuration by means of the installation assistant, you must use the standard WLAN password SMA12345. After the first ten feed-in hours or after completing the configuration by means of the installation assistant, you must use the device-specific WLAN password (WPA2-PSK) of the inverter. You find the WLAN password (WPA2-PSK) on the type label.

3. Enter the IP address 192.168.12.3 or, if your device supports mDNS services, SMA[serial number].local or https://SMA[serial number] in the address bar of the web browser and press the enter key.
4. **Web browser signals a security vulnerability**
   After the IP address has been confirmed by pressing the enter key, a message might appear indicating that the connection to the user interface of the inverter is not secure. SMA Solar Technology AG guarantees that calling up the user interface is secure.
   - Continue loading the user interface.
   - The login page of the user interface opens.

7.3.3 **Establishing a Connection via Ethernet in the local network**

- **New IP address for connecting with a local network**
  If the product is connected to a local network (e.g. via a router), the product will receive a new IP address. Depending on the type of configuration, the new IP address will be assigned automatically by the DHCP server (router) or manually by you. Upon completion of the configuration, the product can only be reached via the following access addresses:
    - Generally applicable access address: IP address manually assigned or assigned by the DHCP server (router) (identification via network scanner software or network configuration of the router).
    - Access address for Apple and Linux systems: SMA[serial number].local (e.g. SMA0123456789.local)
    - Access address for Windows and Android systems: https://SMA[serial number] (e.g. https://SMA0123456789)

**Requirements:**
- The product must be connected to the local network via a network cable (e.g. via a router).
- The product must be integrated into the local network. Tip: There are various methods of integrating the product into the local network with the aid of the installation assistant.
- An end device (e.g. computer, tablet PC or smartphone) must be available.
- The end device must be in the same local network as the product.
- The respective latest version of one of the following web browsers must be installed: Chrome, Edge, Firefox, Internet Explorer or Safari.
- The SMA Grid Guard code of the Installer must be available for the changing of grid-relevant settings after completion of the first ten feed-in hours or installation assistant (see “Application for SMA Grid Guard Code” at www.SMA-Solar.com).

**Procedure:**
1. Open the web browser of your end device, enter the IP address of the inverter in the address line of the web browser and press the enter key.
2. **Web browser signals a security vulnerability**

After the IP address has been confirmed by pressing the enter key, a message might appear indicating that the connection to the user interface of the inverter is not secure. SMA Solar Technology AG guarantees that calling up the user interface is secure.

- Continue loading the user interface.

☑ The login page of the user interface opens.

### 7.3.4 Establishing a Connection via WLAN in the Local Network

#### i New IP address for connecting with a local network

If the product is connected to a local network (e.g. via a router), the product will receive a new IP address. Depending on the type of configuration, the new IP address will be assigned automatically by the DHCP server (router) or manually by you. Upon completion of the configuration, the product can only be reached via the following access addresses:

- Generally applicable access address: IP address manually assigned or assigned by the DHCP server (router) (identification via network scanner software or network configuration of the router).
- Access address for Apple and Linux systems: SMA[serial number].local (e.g. SMA0123456789.local)
- Access address for Windows and Android systems: https://SMA[serial number] (e.g. https://SMA0123456789)

#### Requirements:

- The product must be commissioned.
- The product must be integrated into the local network. Tip: There are various methods of integrating the product into the local network with the aid of the installation assistant.
- An end device (e.g. computer, tablet PC or smartphone) must be available.
- The end device must be in the same local network as the product.
- The respective latest version of one of the following web browsers must be installed: Chrome, Edge, Firefox, Internet Explorer or Safari.
- The SMA Grid Guard code of the Installer must be available for the changing of grid-relevant settings after completion of the first ten feed-in hours or installation assistant (see "Application for SMA Grid Guard Code" at www.SMA-Solar.com).

#### Importing and exporting files with end devices having an iOS operating system is not possible.

For technical reasons, importing and exporting files (e.g. importing an inverter configuration, saving the current inverter configuration or exporting events and parameters) is not possible with mobile end devices having an iOS operating system.

- Use an end device that does not have an iOS operating system for importing and exporting files.

#### Procedure:

1. Enter the IP address of the inverter in the address bar of the web browser.
2. **Web browser signals a security vulnerability**

   After the IP address has been confirmed by pressing the enter key, a message might appear indicating that the connection to the user interface of the inverter is not secure. SMA Solar Technology AG guarantees that calling up the user interface is secure.
   
   - Continue loading the user interface.
   - The login page of the user interface opens.

### 7.4 Logging Into the User Interface

After a connection to the user interface of the inverter has been established, the login page opens. Log onto the user interface as described below.

**Procedure:**

1. In the drop-down list **Language**, select the desired language.
2. In the **User group** drop-down list, select the entry **Installer**.
3. In the **New password** field, enter a new password for the **Installer** user group.
4. In the **Repeat password** field, enter the new password again.
5. Select **Login**.

   ✔ The **Configuring the Inverter** page opens.
7.5 Selecting a configuration option

After you have logged onto the user interface as **Installer**, the **Configuring the Inverter** page opens.

---

<td></td>
<td>the user interface is called up again</td>
</tr>
<tr>
<td>E</td>
<td>Configuration options</td>
<td>Provides a selection of the various configuration options</td>
</tr>
</tbody>
</table>

**Procedure:**

On the **Configuring the Inverter** page, different configuration options are available to choose from. Select one of the options and proceed for the selected option as described below. SMA Solar Technology AG recommends carrying out the configuration with the installation assistant. This way, you ensure that all relevant parameters are set for optimal inverter operation.

- Adoption of configuration from a file
• Configuration with the installation assistant (recommended)
• Manual configuration

Accepting the settings
Saving the made settings is indicated by an hourglass symbol on the user interface. If the DC voltage is sufficient, the data is transferred directly to the inverter and accepted. If the DC voltage is too low (e.g., in the evening), the settings are saved, but they cannot be directly transferred to or accepted by the inverter. As long as the inverter has not yet received and accepted the settings, the hourglass symbol will continue to be displayed on the user interface. The settings will be accepted when there is sufficient DC voltage applied and the inverter restarts. As soon as the hourglass symbol appears on the user interface, the settings have been saved. The settings will not be lost. You can log off of the user interface and leave the system.

Adopting the Configuration from a File
You can adopt the inverter configuration from a file. To do this, there must be an inverter configuration saved to a file.

Procedure:
1. Select the configuration option Adopting configuration from a file.
2. Select [Browse...] and select the desired file.
3. Select [Import file].

Configuring the Installation Assistant (Recommended)

Position | Designation       | Description                                                                 |
---|-------------------|-----------------------------------------------------------------------------|
B   | User information | Information about the current configuration step and the setting options of the configuration step. |
C   | Configuration field | You can make settings in this field.                                          |

**Procedure:**
1. Select the configuration option **Configuration with Installation Assistant**.
   - ✔ The installation assistant will open.
2. Follow the installation assistant steps and make the settings appropriate for your system.
3. For every setting made in a step, select [Save and next].
   - ✔ In the last step, all made settings are listed in a summary.
4. To save the settings to a file, select [Export a summary] and save the file on your computer, tablet PC or smartphone.
5. To export all parameters and their settings, select [Export all parameters]. This exports all parameters and their settings into an HTML file.
6. To correct settings you made, select [Back], navigate to the desired step, correct settings and select [Save and continue].
7. Once all settings are correct, select [Next] in the summary.
   - ✔ The start page of the user interface opens.

**Manual configuration**
You can configure the inverter manually by setting the desired parameters.

**Procedure:**
1. Select the configuration option **Manual Configuration**.
   - ✔ The **Device Parameters** menu on the user interface will open and all available parameter groups of the inverter will be displayed.
2. Select [Edit parameters].
3. Select the desired parameter group.
   - ✔ All available parameters of the parameter group will be displayed.
4. Set the desired parameters.
5. Select [Save all].
   - ✔ The inverter parameters are set.
8 Disconnecting the Inverter from Voltage Sources

Prior to performing any work on the inverter, always disconnect it from all voltage sources as described in this section. Always adhere to the prescribed sequence.

**DANGER**

Danger to life due to electric shock when live components or DC conductors are touched

When exposed to sunlight, the PV array generates dangerous direct voltage. Even if the DC load-break switch of the inverter is in the O, position, there will be dangerous direct voltage present in the DC conductors and on the DC-in terminal block in the Connection Unit. Touching live DC conductors results in death or lethal injuries due to electric shock.

- If an external DC disconnecting switch is available, open the external DC disconnecting switch.
- Leave the DC-in terminal block plugged into the Connection Unit and only touch it on the black enclosure.

**NOTICE**

Destruction of the measuring device due to overvoltage

- Only use measuring devices with a DC input voltage range of 600 V or higher.

**Procedure:**

1. Disconnect the AC circuit breaker and secure it against reconnection.
2. Set the DC load-break switch of the inverter to O.

![Image of DC load-break switch set to O]

3. Secure the DC load-break switch against reconnection using a suitable padlock.

![Image of padlock securing DC load-break switch]

4. If the multifunction relay is used, switch off any supply voltage to the load.
5. Wait until the LEDs have gone out.
6. Unscrew all six screws of the enclosure lid of the Connection Unit and remove the enclosure lid carefully towards the front (TX25). When doing so, note that the LED assembly in the enclosure lid and the communication assembly in the inverter are connected via a ribbon cable.

7. Pull the ribbon cable connecting the LED assembly in the enclosure lid to the communication assembly out of the jack located on the communication assembly.

8. Use a current clamp to ensure that no current is present in the DC conductors.

9. Ensure there is no voltage on the AC-out terminal block between L1 and N and L2 and N using a suitable measuring device. To do this, stick the test probe in each rectangular opening of the terminal.

10. Ensure there is no voltage on the AC-out terminal block between L1 and the equipment grounding conductor and L2 and the equipment grounding conductor using a suitable measuring device. To do this, stick the test probe in each rectangular opening of the terminal.
9 Decommissioning the Inverter

To decommission the inverter completely upon completion of its service life, proceed as described in this Section.

⚠️ CAUTION

**Risk of injury due to weight of product**
Injuries may result if the product is lifted incorrectly or dropped while being transported or when attaching it to or removing it from the wall mounting bracket.
- Transport and lift the product carefully. Take the weight of the product into account.
- Wear suitable personal protective equipment for all work on the product.

Procedure:

1. ⚠️ DANGER

**Danger to life due to high voltages**
- Disconnect the inverter from all voltage sources (see Section 8, page 61).

2. Remove the DC conductors from the **DC-in** terminal block. To release the conductors from the terminals, open the terminals with a flat-blade screwdriver (blade width: 3.5 mm [0.14 in]). While doing so, only touch the terminal block on the black enclosure.

3. Screw out the screws from the **DC-in** terminal block using a flat-blade screwdriver (blade width: 3.5 mm [0.14 in]) and pull the terminal block out of the slot. While doing so, only touch the terminal block on the black enclosure.

4. Remove the conductor L1, L2 and, if necessary, N from the **AC-out** terminal block. To release the conductors from the terminals, open the terminals with a flat-blade screwdriver (blade width: 3.5 mm [0.14 in]).

5. Screw out the screws from the **AC-out** terminal block using a flat-blade screwdriver (blade width: 3.5 mm [0.14 in]) and pull the terminal block out of the slot.

6. Remove all equipment grounding conductors from the equipment grounding terminals. To do this, remove each screw (TX 25) and remove the equipment grounding conductor from the inverter; screw each screw back in (TX 25).

7. Remove all connection cables from the communication assembly. Tip: To release the cables from the plugs, open the conduit entries using a suitable tool.

8. Remove all conduits with conductors from the inverter. To do this, screw the sleeves out of the enclosure openings from the inside.

9. Seal all enclosure openings with sealing plugs.

10. Lead the enclosure lid to the Connection Unit and plug the display cable into the socket on the communication assembly.

11. Ensure that the display cable is securely plugged into the sockets at both ends.

12. Position the enclosure lid of the Connection Unit on the enclosure and tighten all 6 screws crosswise (TX 25, torque 3 Nm ± 0.3 Nm [26.55 in-lb ± 2.65 in-lb]).
13. If the inverter is secured against theft with a padlock, open the padlock and remove it from the inverter.
14. Unscrew the screw M5x60 which fastens the inverter to the wall mounting bracket (TX25).
15. Remove the inverter by lifting it vertically up and off the wall mounting bracket.
16. Unscrew the screws for fastening the wall mounting bracket and remove the wall mounting bracket.
17. If the inverter is to be stored or shipped, pack the inverter and the wall mounting bracket. Use the original packaging or packaging that is suitable for the weight and dimensions of the inverter and secure the packaging with tension belts, if necessary.
18. Dispose of the inverter in accordance with the locally applicable disposal regulations for electronic waste.

### 10.2 AC Output, Secure Power Supply Operation

- **Maximum AC power**: 2000 W
- **Nominal AC voltage**: 120 V
- **AC voltage range**: 109 V to 132 V
- **Maximum output current**: 16 A
- **Minimum load**: 1 W

### 10.3 Multifunction Relay

- **Maximum DC switching voltage**: 30 V
- **Maximum AC switching current**: 1.0 A
- **Maximum DC switching current**: 1.0 A
- **Minimum load**: 0.1 W
- **Minimum electrical endurance when the maximum switching voltage and maximum switching current are complied with**: 100000 switching cycles

*Corresponds to 20 years at 12 switching operations per day*

11 Compliance Information

FCC Compliance
This device complies with Part 15 of the FCC Rules and with Industry Canada licence-exempt RSS standard(s).
Operation is subject to the following two conditions:
1. this device may not cause harmful interference, and
2. this device must accept any interference received, including interference that may cause undesired operation.

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence.
L'exploitation est autorisée aux deux conditions suivantes :
1. l'appareil ne doit pas produire de brouillage, et
2. l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

NOTE: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
• Reorient or relocate the receiving antenna.
• Increase the separation between the equipment and receiver.
• Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
• Consult the dealer or an experienced radio/TV technician for help.

Changes or modifications made to this equipment not expressly approved by SMA Solar Technology AG may void the FCC authorization to operate this equipment.

IC Compliance
This Class B digital apparatus complies with Canadian ICES-003.
Cet appareil numérique de la classe B est conforme à la norme NMB-003 du Canada.
12 Contact

If you have technical problems with our products, please contact the SMA Service Line. The following data is required in order to provide you with the necessary assistance:

- Device type
- Serial number
- Firmware version
- Event message
- Mounting location and mounting height
- Type and number of PV modules
- Optional equipment, e.g. communication products
- Use the name of the system in Sunny Portal (if available)
- Access data for Sunny Portal (if available)
- Special country-specific settings (if available)
- Operating mode of the multifunction relay
